Hitch Installation Instruction

Step	Description							
1	Assemble Hitch Body (A) and Mounting Brackets (B, C) with (8) M12X1.75-35mm Hex Bolts, (16) M12 Flat Washers, (8) M12 Hex Flange Nuts.(Hardware in " HW A ").							
2	Locate and remove the two bolts from the frame using a 15mm socket and three bolts using an 18mm socket as shown. Remove the bolt(s) securing the exhaust and muffler hanger(s). This will allow the exhaust to drop out of the way for hitch installation.							
3	Raise the hitch into position against the bottom of the vehicle frame and align the holes in the hitch frame brackets with the holes in the vehicle frame. Make sure air conditioning lines are not pinched between the hitch and frame rail (if applicable). Some fascia trimming may be required, see diagram. Fascia trim diagram							
4	Mount hitch using existing M10 and M12 bolts. You may need a punch or screwdriver to align the holes.							
5	Torque all M10 fasteners to 48 lb-ft and all M12 fasteners to 86 lb-ft.							
6	Raise the muffler back into position and reinstall any other exhaust hardware removed in Step 1. Note: Rotating the exhaust hanger bracket before tightening will add clearance between the side bracket and the exhaust.							
	***Periodically Check The Receiver Hitch To Ensure That All Fasteners *** Are Tight & All Structural Components Are Sound.
